

3

branched bisphenol-A polycarbonate having a 0.34 mole percent level of THPE. The prior problems were not observed to any great extent and the bottle was found to be acceptable for marketing purposes. There was nothing predictable about the usage of lower levels of branching agent in the randomly branched aromatic polycarbonate to bring about the removal of the observed problems.

What is claimed is: .

1. A blow molded article which is a bottle molded from a composition comprising a randomly branched aromatic polymer said randomly branched aromatic polymer comprising:

- (1) a carbonate precursor.
- (2) a dihydric phenol; and

4

(3) 1,1,1-tris-(4-hydroxyphenyl) ethane as a branching agent;

wherein said branching agent is present in said polymer in a quantity ranging from about 0.28 to about 0.36 mole percent based on the amount of said dihydric phenol present in said polymer.

2. An article in accordance with claim 1 wherein the bottle is adapted to contain one gallon of liquid.

3. The bottle of claim 1 wherein the carbonate precursor comprises bisphenol-A.

4. The bottle of claim 3 wherein the branching agent 1,1,1-tris-(4-hydroxyphenyl)ethane is present in an amount ranging from about 0.30 to about 0.34 mole percent based on the amount of said dihydric phenol present in said polymer.
